1 Model

About notation Without loss of generality when I write x_t I really mean $x(s^t)$. When the history dependence is potentially unclear, I will it out in longer form.

The Lagrangian is

$$\mathcal{L} = \mu_{1,0}V_{1,0}\left(c_{1,0}, V_{1,1}\right) \qquad +\mu_{2,0}V_{2,0}\left(c_{2,0}, V_{2,1}\right)$$
$$\sum_{t=0}^{\infty}\sum_{s^t}\left\{\lambda_1(s^t)\left(Y_1\left(\chi_{1,t}/g_t, 1\right) - a_{1,t} - a_{2,t} - i_{1,a,t} - i_{2,a,t}\right) + \right.$$
$$\lambda_2(s^t)\left(Y_2\left(\chi_{2,t}/g_t, \xi_t\right) - b_{1,t} - b_{2,t} - i_{1,b,t} - i_{2,b,t}\right) +$$
$$\lambda_3(s^t)\left((1-\delta_1)\frac{\chi_{1,t-1}}{g_{t-1}} + H_1\left(i_{1,a,t-1}, i_{1,b,t-1}\right) - \chi_{1,t}\right) +$$
$$\left.\lambda_4(s^t)\left((1-\delta_2)\frac{\chi_{2,t-1}}{g_{t-1}} + H_2\left(i_{2,a,t-1}, i_{2,b,t-1}\right) - \chi_{2,t}\right)\right\},$$
$$(1)$$

where $c_{i,t} = G_i(a_{i,t}, b_{i,t})$ and $\chi_{i,t} = g(s^t)k_i(s^t)$ for $i = 1, 2$ and $t = 0, 1, \ldots, \infty$.

2 FOC

The control variables are: $\{a_n(s^t), b_n(s^t), i_{n,a}(s^t), i_{n,b}(s^t), \chi_n(s^t)\}$ for $t = 0, 1, \ldots, \infty$, $n \in 1, 2$, and all histories of states s^t. The FONC are

$$a_1(s^t): \quad \mu_{1,0} \frac{\partial V_{1,0}}{\partial V_{1,t}} \frac{\partial V_{1,t}}{\partial c_{1,t}} \frac{\partial c_{1,t}}{\partial a_{t,1}} \qquad\qquad = \lambda_1(s^t) \qquad (2)$$

$$b_1(s^t): \quad \mu_{1,0} \frac{\partial V_{1,0}}{\partial V_{1,t}} \frac{\partial V_{1,t}}{\partial c_{1,t}} \frac{\partial c_{1,t}}{\partial b_{t,1}} \qquad\qquad = \lambda_2(s^t) \qquad (3)$$

$$i_{1,a}(s^t): \quad \sum_{s^{t+1}} \lambda_3(s^{t+1}) \frac{\partial H_1(i_{1,a}(s^t), i_{1,b}(s^t)))}{\partial i_{1,a}(s^t)} \qquad = \lambda_1(s^t) \qquad (4)$$

$$i_{1,b}(s^t): \quad \sum_{s^{t+1}} \lambda_3(s^{t+1}) \frac{\partial H_1(i_{1,a}(s^t), i_{1,b}(s^t)))}{\partial i_{1,b}(s^t)} \qquad = \lambda_2(s^t) \qquad (5)$$

$$\chi_1(s^t): \quad \lambda_1(s^t) \frac{\partial Y_1(\chi_{1,t}/g_t, 1)}{\partial(\chi_{1,t}/g_t)} \frac{1}{g_t} + \sum_{s^{t+1}} \frac{(1-\delta_1)}{g(s^{t+1}|s^t)} \lambda_3(s^{t+1}) = \lambda_3(s^t) \qquad (6)$$

$$a_2(s^t): \quad \mu_{2,0} \frac{\partial V_{2,0}}{\partial V_{2,t}} \frac{\partial V_{2,t}}{\partial c_{2,t}} \frac{\partial c_{2,t}}{\partial a_{t,2}} \qquad\qquad = \lambda_1(s^t) \qquad (7)$$

$$a_2(s^t): \quad \mu_{2,0} \frac{\partial V_{2,0}}{\partial V_{2,t}} \frac{\partial V_{2,t}}{\partial c_{2,t}} \frac{\partial c_{2,t}}{\partial b_{t,2}} \qquad\qquad = \lambda_2(s^t) \qquad (8)$$

$$i_{2,a}(s^t): \quad \sum_{s^{t+1}} \lambda_4(s^{t+1}) \frac{\partial H_2(i_{2,a}(s^t), i_{2,b}(s^t)))}{\partial i_{4,a}(s^t)} \qquad = \lambda_1(s^t) \qquad (9)$$

$$i_{2,b}(s^t): \quad \sum_{s^{t+1}} \lambda_4(s^{t+1}) \frac{\partial H_2(i_{2,a}(s^t), i_{2,b}(s^t)))}{\partial i_{4,b}(s^t)} \qquad = \lambda_2(s^t) \qquad (10)$$

$$\chi_2(s^t): \quad \lambda_2(s^t) \frac{\partial Y_2(\chi_{2,t}/g_t, 1)}{\partial(\chi_{2,t}/g_t)} \frac{1}{g_t} + \sum_{s^{t+1}} \frac{(1-\delta_1)}{g(s^{t+1}|s^t)} \lambda_4(s^{t+1}) = \lambda_4(s^t) \qquad (11)$$

3 Algebra

3.1 Definitions

Before proceeding, we will gather some tools we will use while analyzing the above conditions. First, notice that by the chain rule we have

$$\frac{\partial V_{i,0}}{\partial V_{i,t}} = \prod_{\tau=1}^{t} \frac{\partial V_{i,\tau-1}}{\partial V_{i,\tau}}. \qquad (12)$$

The notice that we can write the SDF for agent i as

$$M_{i,t+1} = \frac{\partial V_{i,t}}{\partial V_{i,t+1}} \frac{\partial V_{i,t+1}/\partial c_{i,t+1}}{\partial V_{i,t}/\partial c_{i,t}}$$

$$= \beta \left(\frac{C_{t+1}}{C_t}\right)^{\rho-1} \left(\frac{V_{i,t+1}}{E\left[V_{i,t+1}^\alpha\right]^{1/\alpha}}\right)^{\alpha-\rho}.$$

We will also write stochastic discount factor in a and b units as follows:
We will make use of the time t Pareto weight, which we define as

$$
\begin{aligned}
\mu_{i,t} &= \mu_{i,0} \frac{\partial V_{i,0}}{\partial V_{i,t}} \frac{\partial V_{i,t}}{\partial c_{i,t}} \\
&= \mu_{i,0} \prod_{\tau=1}^{t} \frac{\partial V_{i,\tau-1}}{\partial V_{i,\tau}} \frac{\partial V_{i,t}}{\partial c_{i,t}} \\
&= \mu_{i,t-1} \frac{\partial V_{i,t}}{\partial V_{i,t+1}} \frac{\partial V_{i,t+1}/\partial c_{i,t+1}}{\partial V_{i,t}/\partial c_{i,t}} \\
&= \mu_{i,t-1} M_{i,t}
\end{aligned}
\tag{13}
$$

We will also work with the variable, $S_t = \frac{\mu_{1,t}}{\mu_{2,t}}$, which according to (13) can be written recursively as

$$
S_t = S_{t-1} \frac{M_{1,t-1}}{M_{2,t-1}}
$$

3.2 Working with FOC

We can take (4) and turn it into

$$
\frac{1}{\frac{\partial H_1(i_{1,a}(s^t), i_{1,b}(s^t))}{\partial i_{1,a}(s^t)}} = E\left[M_{1,t+1} P_{k,t+1}\right]
$$

We can also transform (6) to

$$
P_{k,t} = \frac{\partial Y(\chi_{1,t}/g(s^t))}{\partial \chi_{1,t}/g(s^t)} \frac{1}{g(s^t)} + E\left[\frac{(1-\delta)}{g(s^{t+1})} M_{1,t+1} P_{k,t+1}\right]
$$

where $P_{k,t} = \frac{\lambda_{3,t}}{\lambda_{1,t}}$ and can be interpreted as the price of capital in terms of good a.

4 algebra

Using (13), (2), and (7) we can derive

$$
\begin{aligned}
\mu_{1,t} \frac{\partial c_{1,t}}{\partial a_{1,t}} &= \mu_{2,t} \frac{\partial c_{2,t}}{\partial a_{2,t}} \\
S_t \frac{\partial c_{1,t}}{\partial a_{1,t}} &= \frac{\partial c_{2,t}}{\partial a_{2,t}}
\end{aligned}
\tag{14}
$$

Similarly using (13), (3), and (8) we can derive

$$\mu_{1,t} \frac{\partial c_{1,t}}{\partial b_{1,t}} = \mu_{2,t} \frac{\partial c_{2,t}}{\partial b_{2,t}}$$

$$S_t \frac{\partial c_{1,t}}{\partial b_{1,t}} = \frac{\partial c_{2,t}}{\partial b_{2,t}} \tag{15}$$
